Fibroepithelial Polyp
Joseph Junewick, MD FACR
07/05/2009

History
Infant male with urinary tract infection.

Diagnosis
Fibroepithelial Polyp

Additional Clinical
Surgery-Filiform polyp arising from the veru montanum.
Pathology-Ulcerating/granulating squamous epithelium covering a fibrovascular stroma with occasional smooth muscle bundles.

Discussion
Urethral polyps are a rare anomaly of the male urethra. Most commonly these originate from the veru montanum. Presenting symptoms include urinary retention, incomplete voiding, urgency, and hematuria. Etiology is controversial; congenital, inflammatory, and traumatic theories have been proposed. Differential diagnosis includes blood clot, cystitis cystica, papilloma and other mucosal disorders. Surgical excision is curative.

Findings
US-Hypervascular filiform soft tissue mass protruding into the urinary bladder.
VCUG-Urinary bladder filling defect emanating from the urethrovesical junction.
